

# BE A FEEDSCAN WIZ

## Tips and tricks to make the FeedScan app work for you.

The FeedScan sample-submission application offers convenience and time savings, but have you tapped into all of its benefits? Check out these suggestions to improve your experience and success with this tool from Rock River Laboratory.

### **Desiring more long-term feedstuff information? Try this.**

**Samples in average:** This tool is only available to FeedScan users and reports an average of previous analyses of this sample source for easy reference. Located on the description page, users can use this to select how many previous analyses should be included in the average.

### **Trying to reduce confusion on results reports? Here's a suggestion.**

**Crop year:** Located on the description page, this value will appear on the results report for your sample. No need to include the crop year in your sample description as this will duplicate the crop year on the results report.

### **Want to improve efficiency? Avoid this.**

**Back button:** Avoid using the back button on your Android phone to go back to previous screens while in the FeedScan app. Using this button will cancel your sample submission process and take you back to the beginning. Instead, utilize the 'Back' button within the FeedScan app to navigate to previous screens.

### **Need to save time with repeat sampling? Here's a shortcut.**

**Profiles:** Located on upper left-hand corner of the 'Tests' page, the 'Save as profile...' function allows you to save all the selections you've requested on the sample you're submitting. Name the profile something you'll recognize and it will appear on the Profiles screen the next time you want to submit a sample from the same source. Simply select the appropriate profile, skip all the app screens to review, and then submit. Easy peasy.

### **Want to reduce human error on your submissions? Here's an idea.**

**Delete:** Much like an e-mail inbox, your FeedScan application houses A LOT of information as you save it. Cut the clutter and reduce error by deleting the selection. Swipe left on an Apple device or long-press on an Android to make a red delete button appear. Tap the delete button and poof! It's history.

### **No service? No problem!**

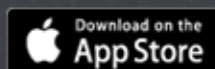

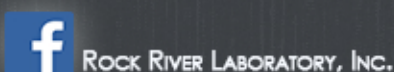

**Submit:** Enter all of your sample submission information as you would with cellular service, then hit submit. FeedScan will provide a note that "because internet access is not available, this sample has been queued for later submission...". The number of queued samples you've submitted shows up as a yellow badge with a number on the FeedScan icon on your phone, and on the home screen under "Unsubmitted samples". When service is available, simply hit the "Unsubmitted samples" to view the unsubmitted samples. You will have a chance to review them, or simply click the "Submit all" button and all sample information will be submitted.

### **Special instructions? Use this tool.**

**Additional Information:** Located on the info page, this large form field offers an area to share specific sample information with the Rock River Laboratory technical team.

### **Not important? Skip this for time savings.**

**Info screen:** This screen is optional. If these options don't apply to your sample or you don't have use for identifying cutting, storage time, etc., simply hit next and continue your sample-submission process.
