

SHIFTING TO THE SPRING PERSPECTIVE

The long-standing fall soil sampling convention has run its course. While the industry progresses and fertilizer prices rise to new heights, it's apparent that spring sampling offers several benefits **and boasts no significant difference in results as compared to fall sample analysis***. Shifting perspective to spring might be just the refreshing change your acres need.

Don't hesitate, spring sampling means:

- More time to develop a fertility plan for next year's crop
- Greater flexibility in fertilizer purchase timing to hit markets right
- Accounting for winter nutrient deposits to provide results that match actual soil conditions of the growing plants

Rock River Laboratory removes spring sampling challenges:

- No babysitting samplers
- No paperwork
- No post-sampling recommendations needed until fall

*As seen by results from research conducted at Rock River Laboratory, 2015.
